1 Change log

VERSION	DATE	DESCRIPTION
1.0	2026-08-13	Initial generated version

2 Overview

Order cache where clients can search for orders and get history on orders and tasks

Documented server endpoints: <https://api-sit-global.tdcnet.dk/net-ordercache>.

3 Interaction with TDC NET API

3.1 Security setup

Security follows the getting-started model for TDCNET API Gateway security and Ping. A client creates and signs a JSON Web Token (JWT), exchanges it for an access token, and then uses that access token when calling the service.

3.2 Documentation

The OpenAPI file remains the technical source of truth. This PDF is the human-readable review artifact generated from that contract.

3.3 Chinese walls

TDC NET ensures that only subscribers related to the individual ISP can be operated through the relevant API services.

4 The specific API

4.1 GET /api/v1/task/{id}/history

Get Task history

4.2 GET /api/v1/order/{orderNo}/tasks

Get all tasks on a specific order

4.3 GET /api/v1/order/{orderNo}/tasks/history

Get Task history for all tasks on a specific order as a map with '{taskId}':[task history list]

4.4 GET /api/v1/order/{orderNo}/history

Get Order history

4.5 GET /api/v1/order/search

Search for orders

4.6 GET /api/v1/order/{orderNo}

Get Order by order number, will return a complete order with all children (tasks, productchanges, etc.)

5 Attachments

6 Schema

The following tables summarize schemas extracted from the OpenAPI document.

6.1 Error

Used when an API throws an Error, typically with a HTTP error response-code (3xx, 4xx, 5xx)

FIELD	TYPE	REQUIR ED	EXAMPLE	DESCRIPTION
code	string	No		Application relevant detail, defined in the API or a common list.
reason	string	No		Explanation of the reason for the error which can be shown to a client user.
message	string	No		More details and corrective actions related to the error which can be shown to a client user.
status	string	No		HTTP Error code extension
referenceError	string	No		URI of documentation describing the error.
@baseType	string	No		When sub-classing, this defines the super-class.
@schemaLocation	string	No		A URI to a JSON-Schema file that defines additional attributes and relationships
@type	string	No		When sub-classing, this defines the sub-class entity name.
timestamp	string (date-time)	No		The timestamp for the request
path	string	No		The url path, that was called
